Preparation Phase
Setting up Application Environment

Team ID	PNT2022TMID19786
Project Name	Skill / Job Recommender Application

1. Docker CLI Installation:

Go to the first link (given below the screenshot) and download the Docker CLI for your Operating System (OS) of choice after reading the System Requirements.
*You can also install it using the command line.

Once you've downloaded, open it & run the executable file.

After Installing it, Start the Docker Desktop app. If it shows some error follow on screen instructions to rectify it, Worry not. Nothing big, You'll be asked to download the prerequisites which includes downloading the "Linux kernel update package" from Step 4.

However, if you feel trapped somewhere between the process, watch the given YouTube video link (down at Reference:)

Now, your Docker app should open fine and will look like this one below!
